unità lineari

### TECHNICAL CHARACTERISTICS LITEK TOOTHED BELT LINEAR UNITS

Litek Linear Units were created with the express purpose of being affordable at a low cost while maintaining a high technological standard.

They are designed to be simple and functional for assembly, maintenance, and replacement of wear-and-tear parts due to the work cycle over time.

Linear units perform the task of alternatively moving (back and forth) organs, assemblies, and anything else required for industrial purposes.

Toothed Belt Units consist of the following assemblies:

- Bearing House
- Bearing House Referral
- Structural Profile
- Mobile Carriage
- Internal Transmission of Motion
- External Motorization

Toothed Belt Units are not among the high precision systems for translation and repeatability, which are still around excellent values of 0.1-0.2 mm. This depends on the actual tolerances on the pitch of the belt teeth due to the limits imposed by rubber vulcanization. With the toothed belt drive as a counterpart, high travel and acceleration speeds are endured, with low inertia and low friction.

External motorization is variable and chosen according to duty cycle, required reliability, and cost. For each external motorization there are kits of components required for coupling to the unit (drive head shaft, direct motor or gearmotor coupling cam-pan).

**Important:** is the sound anchorage and concrete appositioning of the units on the supporting structures to ensure perfect alignment of linearity in the plane and laterally and thus perfect movement of the carriage while avoiding damaging overloading of the rolling traversing parts (track rollers or recirculating ball carriages).

### TERMS AND CONDITIONS OF USE

#### *Terms of use*

Linear units are guaranteed for use between -10°C and +80°C, dirty environments and hostile conditions require the adoption of the closed and pressurized version of the unit (available for different sizes), however on a case-by-case consultation with the Technical Department.

#### *Tampering Control*

Screws and nuts placed at adjustment or tightening points are marked with paint, so tampering is immediately evident.

**Also considered as tampering are, runaway motor crashes, impacts from external bodies, introduction of various materials, unintended uses, lack of control and maintenance.**

#### *Warranty - Standards*

Litek Modular Units are guaranteed against manufacturing defects and inspected before being shipped to the customer. In case the units need maintenance work, divided by normal working wear and tear, the customer is required to read Litek's Instructions before proceeding and in case contact Linearteck's technical department.

**We disclaim responsibility for any errors, tampering or damage caused in use, and if our recommendations or procedures should not be applied.**

#### *Belt check*

Visual and tactile inspection is very important for the proper functioning and durability of the units. The first check to be made

is to see if the drive belt is tensioned to the right point, and if it turns perfectly in the center of its seat. For centering proceed through one of the two adjusting screws (on the head opposite the motor for ML-MG-MPs or on the carriage for CM-CGs) by turning the screw a few degrees one way or the other and check the belt with the carriage in motion how it behaves, having obtained the desired direction of displacement insist step by step always with the unit in motion until the belt position in the center is reached.

#### *Belt tensioning*

Cyclically (at least every 2000 working hours) when the unit is stopped, check if the belt has maintained the correct tensioning, to accurately measure the belt tensioning use a "Belt Tension Meter" that is an instrument equipped with a microphone that by measuring the frequency through a formula returns a force value. Move the carriage so that there is a free portion of belt to vibrate of 500mm (Lf), at this distance the frequencies of correct tensioning must be: 76 Hz for pitch 5 belts and 88 Hz for pitch 8 belts. To act on the tensioning, by means of the two screws described above, act uniformly, achieving optimum tension for constant carriage movement, without overloading the pulley bearings, ensuring repetitiveness in positioning that would otherwise not be possible.

#### *Belt replacement*

Belt replacement on average is recommended before 12000 operating hours. In the case that the application has static +

dynamic Fx values with safety factor <5 from the value given in the catalog consider early replacement even after an analysis of the condition of the belt. However, do not exceed 5 years of operation due to aging causes of the belt itself.

To replace, loosen the belt completely using the procedure described in tensioning, completely remove the two belt clamps attached to the front of the carriage ends, slide out the belt with the caveat that a gap long enough to facilitate insertion of the new belt should be tied at one end, but first make sure the length is the same as the replaced

one, if necessary cut off the excess with sheet-metal scissors or a cutter, check that in inserting the belt does not twist and that it faces with the teeth toward the center of the module, insert it in the clamps as the old one was placed, clamp the clamps on the carriage then proceed to tensioning as described in the appropriate chapter, it is extremely important to control the centering with the unit in motion (refer to the appropriate chapter).

## MAINTENANCE

### Maintenance of units with sliding shafts and casters (ML-CM)

*Checking the casters.* If all casters rotate at the same speed we are in the correct condition, it means that they all have the same preload and only in this case the loads applied on the carriage are distributed equally on each caster. If, on the other hand, only some casters rotate those that creep will not bear any load but will wear both the contact track and the slide bar and those that rotate will bear all the load by themselves. Ultimately all this shortens the life of the track rollers, greater geometrical errors during movement and early decay of the life of the raceways and the rolling elements that make them up. The unit needs immediate maintenance so as not to permanently compromise the track bars (it is much easier and cheaper to replace the rollers than the track bars).

#### Adjusting or Replacing Casters

Casters can be divided into 2 types: Fixed and Adjustable (both with protective caps). Fixed Casters are the reference point of the carriage with respect to the profile, and are not affected by adjustment because they are mounted in calibrated holes. The Adjustable Casters are those that bring rigidity to the system, which is necessary to obtain the load capacity values loads and moments stated in the catalog. The Adjustable Castors because of their importance must be preloaded very carefully, this approach is achieved by means of grains acting on the shanks of the pins, this with the nuts loosened just enough for the pins to move. (The preload grains are protected by an additional grain).

To intervene on the rollers, remove the protective caps by unscrewing the 2 screws that fasten them; once the caps have been removed, the rollers are visible, so try using two fingers to turn them without the carriage moving; if this happens, it means that they are unloaded; preload them by doing the following: slightly loosen the nut that fastens the rollers without creating play, then turn clockwise the adjusting screws slowly on all the adjustable rollers, until you notice an increase in friction on the sliding bars when turning them with your fingers with the carriage locked, it is essential that the resistance is the same in all the rollers and that there is no play on the pins, at this point turn the two screws clockwise again by about 20° reinser the lockring and tighten the nuts of the pins as they were before.

In any replacement of the rollers, first arrange the fixed ones, then proceed with the adjustable ones as indicated above. Recall that the protective caps also serve to clean and lubricate the slide bars, keep a certain amount of grease in the seats of the two side felt pads through the removal of the two grains on the back of the cap. We also recall that the grains act as a spring register by pressure on the felt.

### Maintenance of units with prismatic guides and recirculating ball carriages (MG-CG-MP-LV)

*Lubrication:* Profile rail systems receive initial in-greasing at the time of assembly, and then need periodic routine maintenance depending on conditions of use. Suitable grease types range from 000 to 3 (NLGI consistency class), lithium soap or lithium complex soap greases based on mineral oil are recommended.

The viscosity of the base oil should be from ISO-VG 68 up to ISO-VG100. At high loads, greases with EP additives are required. Based on current experience, linear units lubricated with mineral oil-based greases, can be kept stored for periods of up to three years under normal conditions (0°C-40°C; humidity <65%; "clean" environment). Lubrication interval **Tf**: In order to roughly calculate the lubrication inter-value in hours before, it is necessary to calculate the speed index GKW defined as follows:  $GKW=60/v \times 2$  ( $v$ =average displacement speed,[m/min])

For values obtained:

$GKW=0,5 \rightarrow Tf=200-400h;$	$GKW=0,5-1 \rightarrow Tf=400-1500h;$
$GKW=1-2 \rightarrow Tf=1500-4000h;$	$GKW=2-3 \rightarrow Tf=4000-8000h;$
$GKW=3-4 \rightarrow Tf=8000-12000h;$	$GKW=4-5 \rightarrow Tf=12000-16000h;$
$GKW=5-6 \rightarrow Tf=16000-20000h;$	$GKW=6-7 \rightarrow Tf=20000-25000h;$
$GKW=7-8 \rightarrow Tf=25000-30000h;$	$GKW=8-9 \rightarrow Tf=30000-35000h;$
$GKW=9-10 \rightarrow Tf=35000-40000h;$	$GKW=10-20 \rightarrow Tf=40000-80000h$

If the stroke is very short (0-100mm), the lubricating grease life may be shorter than the determined guideline values.

#### For strokes longer than 1 meter, halve the Tf obtained.

In MG or CG models having external carriages, grease each carriage directly via the grease nipple on sight; in MP or LV models with internal rails and carriages, grease via the grease nipple hole on the carriage side; a centralized circuit will deliver grease to all carriages (and to the grease nipple for LVs)

#### Nominal service life of a recirculating ball carriage

Nominal life is reached or exceeded by 90 percent of a sufficiently large quantity of the same bearings before the first signs of material fatigue occur. One can indicatively calculate the service life with the following formulas:

$$L=(C/P)^3 \quad L_h=(833)(H^*Nosc)^*(C/P)^3 \quad L_h=(1666/v)^*(C/P)^3$$

$L$ =rated duration in 100Km

$L_h$ =rated duration in operating hours

$C$ =dynamic load capacity (data given in catalog)

$P$ =equivalent dynamic load (applied load)

$H$ =actual stroke MT

$Nosc$ =number of cycles per minute

$V$ =equivalent dynamic speed

In replacing the carriages, if any, proceed as follows: loosen then unhook the belt by means of the appropriate belt clips, slide the carriage out, taking care not to let the balls come out of their seats by using a "false guide."

When reinserting the carriages into the guides, take care that the sealing lip is not damaged and that it does not position itself in a incorrectly.

## IP PROTECTION RATING TABLE

The following is the table with the list of IP rating of protection according to the standard  
**UNI EN60529**

The first digit represents the index of protection against the penetration of solid objects and dust, while the second digit indicates the index of protection against the penetration of liquids; these are valid at standard environmental conditions.

1 <sup>a</sup> Num.	Description	2 <sup>a</sup> Num.	Description
1	Protection from solid objects greater than 50 mm	1	Protection from water drops
2	Protection from solid objects greater than 12 mm	2	Protection from diverted water droplets up to 15°
3	Protection from solid objects greater than 2.5 mm	3	Protection from water vapor
4	Protection from solid objects greater than di 1 mm	4	Protection from splashing water
5	Protection from dust	5	Protection from water jets
6	Strong protection from dust	6	Protection from strong jets of water or storm surges
		7	Protection against immersion
		8	Protection against continuous immersion

## CALCULATION FOR HORIZONTAL TORQUE

CALCULATION OF THE TORQUE REQUIRED FOR MECHANICAL LINEAR UNITS:

$$M_A = \text{Required drive torque (Nm)} \quad M_A = M_{Last} + M_{Leer} \quad M_A \quad 0$$

$$M_{Last} = \text{Load torque (Nm)} \quad M_{Last} = \frac{F_x * p}{2 * \pi * 1000}$$

M<sub>Last</sub> 0

F<sub>x</sub> 0 | p 0

M<sub>Leer</sub> = See data sheets (Nm)

M<sub>Leer</sub>

F<sub>x</sub> = Feed force in horizontal application(N)

F<sub>x</sub> 0 m

0 | g 9,81 | μ a 0

$$F_x = m * g * \mu + m * a$$

μ = friction coefficient for linear guide = 0,02  
 μ = friction coefficient for roller guide = 0,05  
 μ = friction coefficient for sliding guide = 0,1

g = gravitational acceleration

g 9,81

a = acceleration

a

m = transport weight (Kg)

m

p = spindle pitch [mm] (screw drive) or stroke per revolution [mm] (toothed belt drive)

p

= campo da fornire

## CALCOLO PER COPPIA VERTICALE

CALCOLO DELLA COPPIA NECESSARIA PER LE UNITÀ LINEARI MECCANICHE:

$$M_A = \text{Required drive torque (Nm)} \quad M_A = M_{Last} + M_{Leer} \quad M_A \quad 0$$

$$M_{Last} = \text{Load torque (Nm)} \quad M_{Last} = \frac{F_x * p}{2 * \pi * 1000}$$

M<sub>Last</sub> 0

F<sub>x</sub> 0 | p 0

M<sub>Leer</sub> = See data sheets (Nm)

M<sub>Leer</sub>

F<sub>x</sub> = Feed force in vertical application (N)

F<sub>x</sub> 0

m 0 | g 9,81 | a 0

$$F_x = m * (g + a)$$

g = gravitational acceleration

g 9,81

a = acceleration

a

m = transport weight (Kg)

m

p = spindle pitch [mm] (screw drive) or stroke per revolution [mm] (toothed belt drive)

p

= campo da fornire

### Chemical resistances

Class : **6**

**Uses:** it is especially suitable for solid materials even in the presence of moisture and harsh conditions of use: dirt, organic waste, etc.

Not resistant to:

**CAUSTIC SODA> 10% HYDROCHLORIC ACID > 20%  
SODIUM HYPOCHLORITE, SULFURIC ACID> 50%**

## EKL

**Compact elastomer coupling with clamping hub**

- Compact design
- Low moment of inertia
- Simplified assembly

## EK7

**Elastomer coupling with expanding shaft hub**

- Uniform rotation
- Axial mounting of the expansion shaft
- High clamping force

## EK2

**Elastomer coupling with clamping hub**

- Uniform rotation
- Balanced version
- Simplified assembly

## EK1

**Elastomer coupling with keyway mounting**

- Reliable and economical version
- Easy to adapt and modify

## EKH

**Elastomer coupling with fully split clamping hub**

- Uniform rotation
- Axial mounting
- Clamping force very high

## EK6

**Elastomer coupling with conical clamping ring**

- Radial insertion due to hubs with decomposable clamps
- Fastening with tapered clamping set
- Simplified assembly

## EZ2

**Intermediate spacer**

- Radial mounting due to decomposable clamps
- Operation without central support bearing
- Version with tapered clamping set
- Width up to 4 m

## EZV

**Line shaft with split clamping hub and adjustable length**

- Editable length
- Radial mounting due to decomposable clamps
- Does not require intermediate support
- Width up to 4 m

## ESL

**Torque limiter with keyway mounting and elastomer coupling**

- Economic solution
- Compact design
- Multi-position reset

## ES2

**Torque limiter with clamping hubs and elastomer coupling**

- Simplified assembly
- Reliable torque overload protection
- Absence of angular play thanks to the patented R+W solution

## EEx

**For use in exhibition environment**

- Available across the range
- For use in area 1/21 2/22 SERVOMAX EEx elastomer couplings are certified according to ATEX 95a directive

### FUNCTION

The equalizing element of EK joints is the elastomer insert. Torque transmission occurs without backlash and vibration. Therefore, the elastomer is the key element of the joint and the entire transmission.

The joint is backlash-free due to the pretensioning of the elastomer between the two half-joints. SERVOMAX couplings are able to compensate for radial, angular and axial disalignments.

Type A  
shore hardness 98 Sh A

Type B  
shore hardness 64 Sh D

Type C  
shore hardness 80 Sh A

Type D\*  
shore hardness 92 Sh A

### FUNCTION

Type	Shore hardness	Color	Material	Relative damping ( )	Temperature of use	Properties
A	98 Sh A	red	TPU	0,4 - 0,5	-30°C to +100°C	high damping
B	64 Sh D	green	TPU	0,3 - 0,45	-30°C to +120°C	high torsional rigidity
C	80 Sh A	yellow	TPU	0,3 - 0,4	-30°C to +100°C	very high damping
D*	92 Sh A	black	TPU	0,3 - 0,45	-10°C to +70°C	electrical conductivity*

\* Due to its electrical conductivity properties, this elastomer is not subject to electrostatic charge, and any possibility of sparking, during normal operation. Elastomer D, is used in the EEx version that is certified according to the new regulations European ATEX standards.

For more information, see the following paragraphs or contact our technical department.

Relative damping values, are measured at a frequency of 10Hz at a temperature of 20°C

# Coaxial low backlash gearboxes

LITEK®

LC

MP

## Low backlash at a competitive price

LC Series planetary gearboxes are characterized by low angular backlash, high quietness and easy motor-side coupling.

## Good precision for excellent results

MP Series planetary gearboxes are characterized by low angular backlash, several options for the drive side, high quietness and an extremely easy motor-gearbox coupling.

SL

TQ

## Perfect for timing belt drive systems

Tecnoingranaggi's new SL Series is unrivaled in compactness, efficiency and optimization for timing belt pulley drive systems. SL Series low backlash gearboxes are the ideal complement to conveyor belt servo drives and all other applications that need to combine high precision with ultra-compact dimensions.

## Precision at the highest level

TQ series low backlash planetary gearboxes combine outstanding performance with a clear Italian design, making them immediately recognizable among similar products in the industry of reference. Their design and construction has been developed with the primary objective of offering users a series of products of absolute, reliable and repeatable Quality, such as to constitute a competitive advantage for machines and systems that adopt them as transmission components.

## Low backlash planetary gearboxes

As professionals with a technical background, you will certainly be sensitive to issues such as efficiency, productivity and process reliability-priorities of any company in the market today.

alpheno®

The customizable, high-power-density gearbox: more performance in less space.

RP+

The new high-performance gearbox for axial and radial loads far beyond market standards.

SP+/SP+ HIGH SPEED

The great classic among high-performance planetary gears: universal and versatile precision.

TP+/TP+ HIGH TORQUE

The low-backlash planetary gearbox with output flange: compact precision.

LP+/LPB+ Generation 3

The low backlash planetary gearbox, with flange or shaft output interface: convenient precision.

CP-Ares

The ultimate entry-level reducer: simple precision.

Hygienic Design

A stainless and clean line.

alpha Value Line

The new alpha Value Line series of gearboxes.

# Low backlash orthogonal gearboxes

LITEK®

KR

LCK

## The economical, flexible and efficient solution for low backlash angle drives

KR Series low-backlash bevel gearboxes provide the best possible combination of precision, dynamics and compactness. Numerous input and output configurations, as well as various gear ratios, ensure unmatched flexibility.

## The precise, efficient and economical solution when space is a determining factor

LCK series units replicate in ortho-go-nal conformation the brilliant performance characteristics that are already patrimony of the LC coaxial series, adding greater ease of installation in the case of particularly tight spaces.

TQK

## The solution to space-saving problems

The TQK series of low backlash bevel-gearboxes in right-angle configuration are the solution to the space-saving problems sometimes posed by machines that tend toward ever-increasing compactness.

TQK orthogonal assemblies combine high dynamic performance with class-leading precision, and such that they allow great accuracy and repeatability to the placements in which they are used.

TQK groups also feature a typically Italian design, making them immediately recognizable among similar products in the reference industry.

## Angular servosystems

Angular servosystems for increased performance.

High-end flexible, multi-purpose machines place high demands on the quality of the drives they employ: maximum dynamics and performance, small footprint and ease of control, extremely quiet and robust, easy commissioning, and maintenance-free.

RPK+

The new high-performance right-angle gearbox with the most innovative hypoidal technology, the heart of the High Performance Linear System (HPLS).

TK+/TPK+/TPK+ HIGH TORQUE

Wide range of hypoidal gearboxes with TP+ type output flange and hollow shaft.

SK+/SPK+

The hypoidal variant with albero output type SP+

HG+

The representative of the hypoidal range with hollow shaft on one or both sides.

SC+/SPC+/TPC+

High performance, low ratio.

LK+/LPK+/LPBK+

The range of high value-for-money bevel-gearboxes with optional planetary stage.

V-Drive Advanced/  
V-Drive Value

The worm gear servo reducer with solid shaft, hollow shaft or hollow through flange output.

## Standardfit

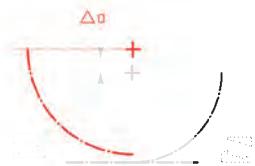

### Features

- Hollow slow shaft interchangeable with gearmotors from major manufacturers
- No additional charge for updating drawings or machine modifications

### Performance

- Excellent efficiency, durability and reliability
- Excellent quiet operation
- "Lifetime" lubrication at zero maintenance cost

### Carcassa monolitica di ghisa con flangia integrale

- High torsional stiffness and excellent load bearing capacity
- Excellent quietness of operation
- Monolithic cast iron housing with integral flange

## QUATTROMAX 30

Electromechanical relubrication unit

The QuattroMax 30 is an electromechanical relubrication unit for automatic lubrication of 4 different points with greases and oils during a long period.

Precise lubrication with minimum amount of lubrication points with low consumption.

- Economic
- Robust and reliable
- Long-lasting lubrication
- Exact minimum quantity lubrication

### Economic

- Easy assembly and commissioning
- Automatic lubrication at all hours
- Excellent lubricant dosage
- System of a high-quality lubricant and an intelligent relubrication lubricator
- Replenishment of 4 lubrication points

### Robust and reliable

- Closed metal house
- Hermetically closed system
- Operable under extreme environmental conditions (dust, water, heat)
- For use in any construction situation

### Long-lasting lubrication

- Transit time is to be programmed individually
- Mode of transit time about up to 60 months
- Lubrication apparatus for minimal quantity, e.g. at 5 years of service: 1.5 cm<sup>3</sup> per year

## QUATTROMAX 30

Transit time	individualmente, fino a 60 mesi
	oli, grassi fino a NLGI 3
Lubricants to be used	67 mm x 145,5 mm
Dimensions (Ø D x L)	G 1/8"
Threaded connection	aluminum
Box material	2 m
Max. tube length	4,3 mm (outside), 3 mm (inside)
Recommended pipe diameter	-20 °C fino a +70 °C
Room temperature	20 bar/290 psi
Max pressurization	IP 68
Protection class	electromechanical
Drive	

## THERMOPLEX ALN 1001/00

G HC P 00 N -40

### LUBCON-Fluid Synthetic Gear Grease

**THERMOPLEX ALN 1001/00** is a high temperature synthetic fluid gear grease based on synthetic hydrocarbons with a special synthetic thickener with high affinity to metal.

#### FEATURES

- high thermal stability to oxidation
- high resistance to loads
- excellent wear protection
- long service life and wide operating temperature
- excellent lubricating properties with low friction values

#### Techinal data

Color/Appearance	slightly colored
Operating temperature °C	-40 fino + 150
Base Oil/Thickener	PAO/Al-complex Speciale
Drop point DIN ISO 2176	200°C
Machined penetration DIN 51804	400 – 430
Class of consistency (NLGI) DIN 51818	00
Dynamic viscosity (cP)	1600
Welding force (VKA) N	
DIN 51359 T 2	2600
Tensile strength DIN 51354	> 12

#### Original packaging

1 kg tin  
25 kg and 50 kg drum

## Linearstop

### Hydraulic – Pneumatic – Electromagnetic

#### Highlights and Advantages

- Safety brake system acc. fail-safe principle
- Backlash-free force transmission having an effect on both sides
- No self-reinforcement during clamping
- Clearing the clamping device is not necessary
- Maximum performance density
- Suitable for EMERGENCY STOP braking actions

- Suitable for dynamic braking actions
- Minimum reaction times
- Integrated switching condition monitoring possible
- Long service lifetime
- Can easily be integrated into existing constructions

#### Linearstop hydraulic

##### Type 380.0\_.\_.0

Clamps a piston rod via a spring-loaded device at the exact position required and backlash-free. The brake is opened with hydraulic pressure of 60 – 75 bar. Suitable for EMERGENCY STOP braking actions.

Nominal holding force: 10000 – 35000 N

#### Linearstop pneumatic

##### Type 381.0\_.\_.0

Clamps a piston rod via a spring-loaded device at the exact position required and backlash-free. The brake is opened with a pneumatic pressure of 4 – 6 bar. Suitable for EMERGENCY STOP braking actions.

##### Type 381.1\_.\_. for dynamic braking actions (acc. Trade Association test regulation)

Clamps and brakes a piston rod via a spring-loaded device at the exact position required and backlash-free. The brake is opened with pneumatic pressure of 4 – 6 bar. If the Technical Data are observed, more than 20,000 dynamic braking actions are possible (tested by the **TÜV-SÜD**, German Technical Inspectorate).

Nominal holding force: 800 – 40000 N

#### Linearstop electromagnetic

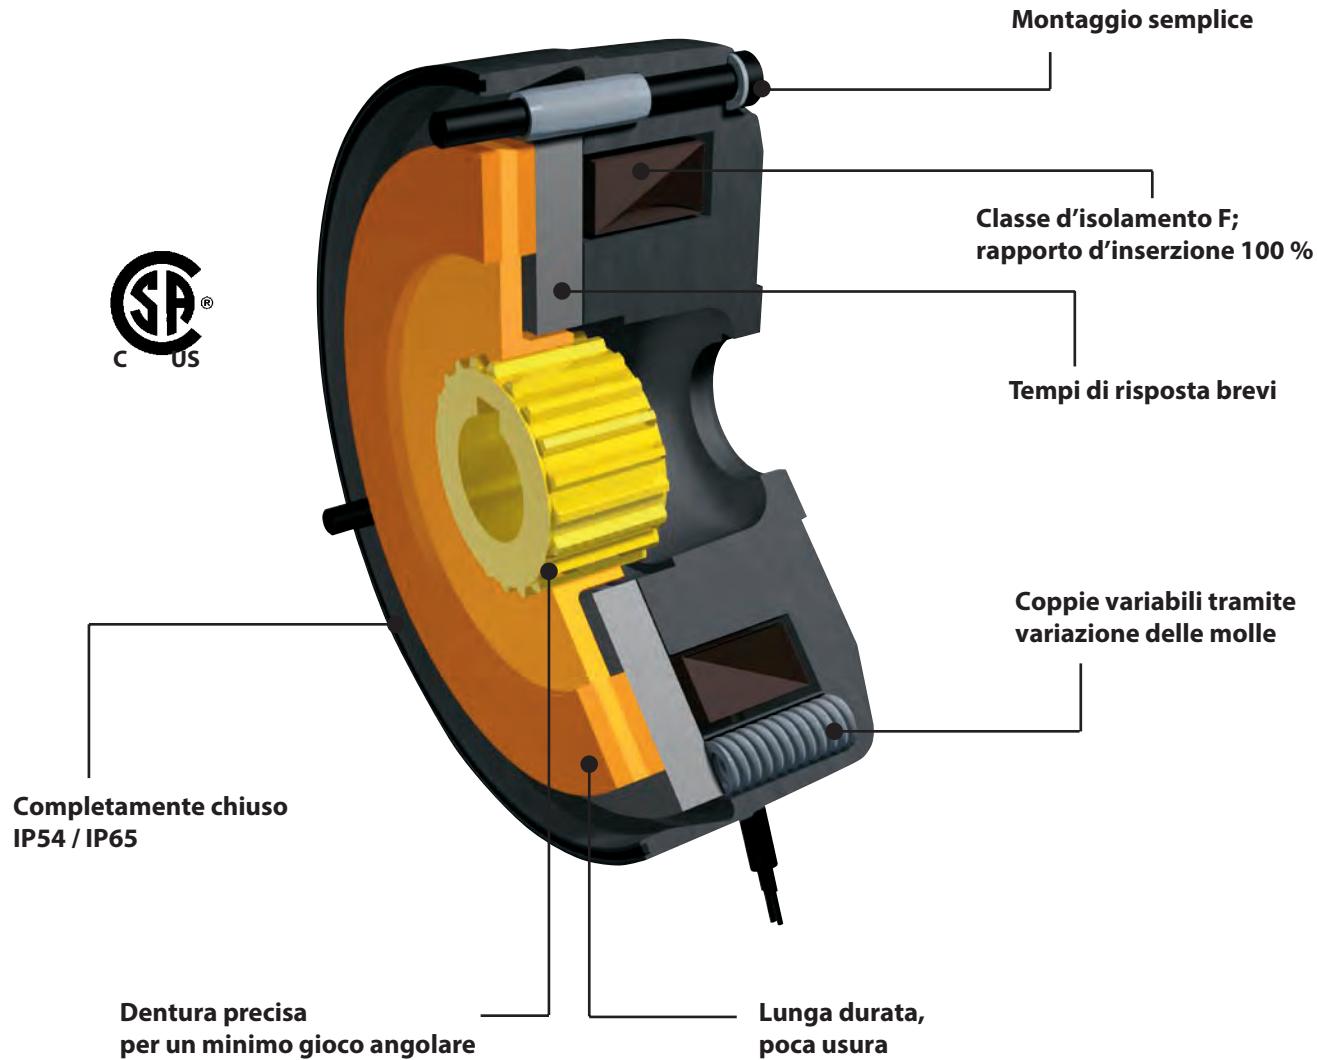

##### Type 382.0\_.\_. (Clamping unit) Type 382.1\_.\_. (for dynamic braking)

Clamps and brakes under spring load a piston rod accurately and backlash-free. Brake is opened through electromagnetic actuation with DC current.

Nominal holding force: 2500 – 17500 N

## Electromagnetic Safety Brakes

### Your safety brake

### Benefits for your applications

- Simple assembly
- Hermetically closed brake on outer diameter (other protections also possible)
- The electromagnetic coil is designed for 100 % insertion ratio.
- The brake is designed for insulation class F.
- Nominal air gap is predetermined and controlled
- Short response times
- Maintenance-free up to rotor wear limit

### Operation

It is an electromagnetic safety brake with compressed springs that intervene in the absence of power.

#### Operation in the absence of power:

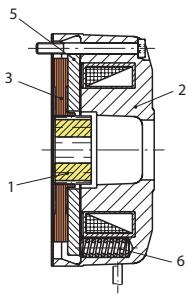

In the absence of power, the coil springs (6) press against the movable anchor (5). The rotor (3) remains pressed between the movable anchor (5) and the wall of the user's machine. The shaft is braked through the hub toothed (1).

#### Electromagnetic:

Through the magnetic force of the coil in the coil carrier (2), the movable anchor (5) is attracted by winning the thrust of the springs toward the coil carrier (2). The rotor is free (4) and the shaft can rotate freely.

#### Safety brakes:

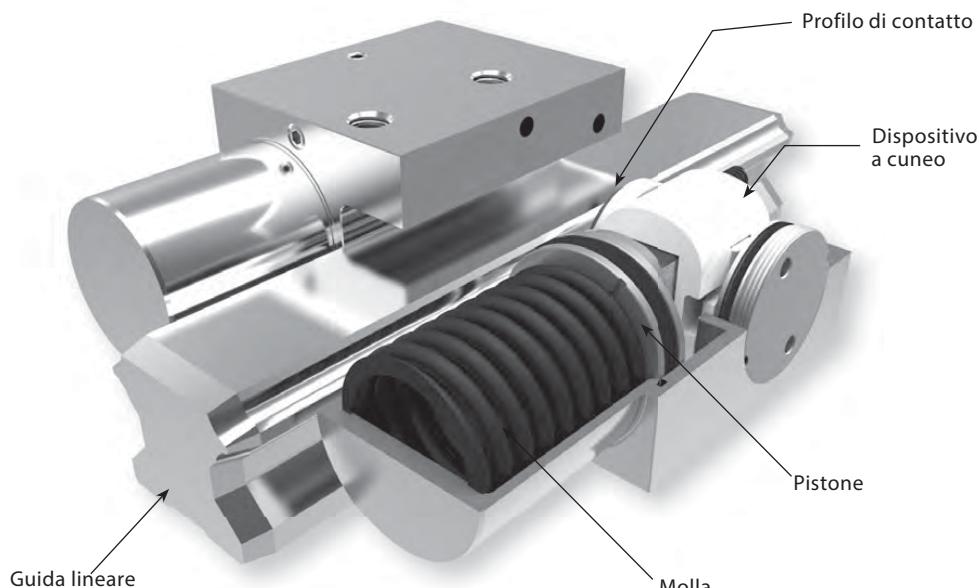

In the event of a power failure or after a power outage or following an EMERGENCY STOP, it brakes reliably and safely.

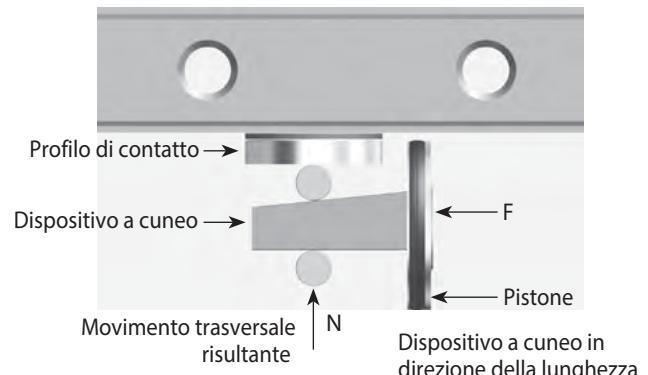

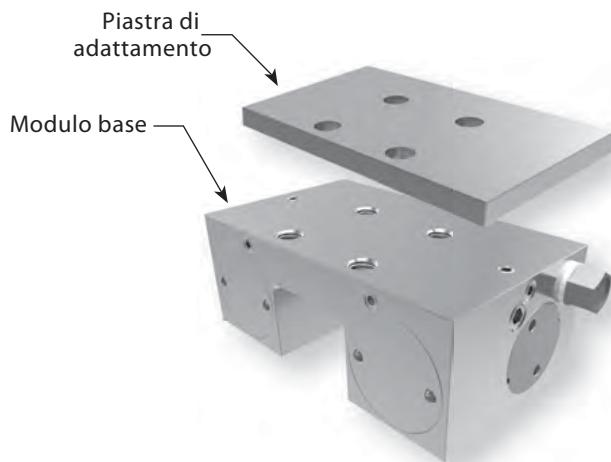

## MKS

### High stopping forces at low costs

The MKS series is the classic series among clamping elements. The patented wedge device produces high holding forces. The pressure medium moves the wedge device in a lengthwise direction. The contact profiles, due to the resulting transverse movement, press with high force on the free surfaces of the profile rail. MKS clamps by means of a spring-loaded energy accumulator and is opened by air input.

#### Serie MKS:

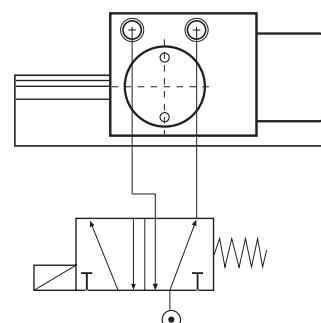

#### MKS series technical features:

Guide size	12-100
Stopping force	250 N-1 450 N
Pressure min.	5,5 bar
Pressure max.	8 bar
Spring energy accumulator	°
PLUS connector	°
Locking cycles	5 milioni (valore B10d)*
Braking cycles	non indicata

#### MKS adapter plate accessory:

Depending on the height of the carriage(size D), an additional adapter plate must be ordered

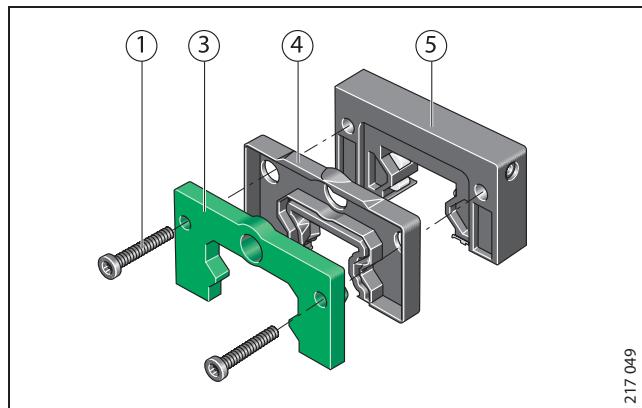

#### Applications of the MKS element:

- Locking in the event of a pressure drop
- Locking without energy requirement

## Checking the delivered condition

A KIT.KWVE..-B-400 consists of:

- ① fixing screws
- ③ a carrier plate for end wiper
- ④ a double lip end wiper
- ⑤ a ready-to-use long-term lubrication unit with initial grease application.

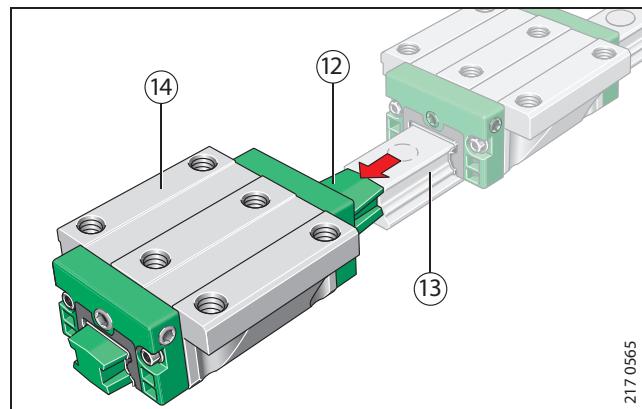

217 049

## Dismantling the carriages

- Position the dummy guideway ⑫ against the guideway ⑬ and slide the carriage ⑭ onto the dummy guideway.

### Caution!

Leave the dummy guideway in the carriage.  
The dummy guideway ⑫ prevents damage to the rolling element set and the loss of rolling elements while the carriage is separate from the guideway.

217 0565

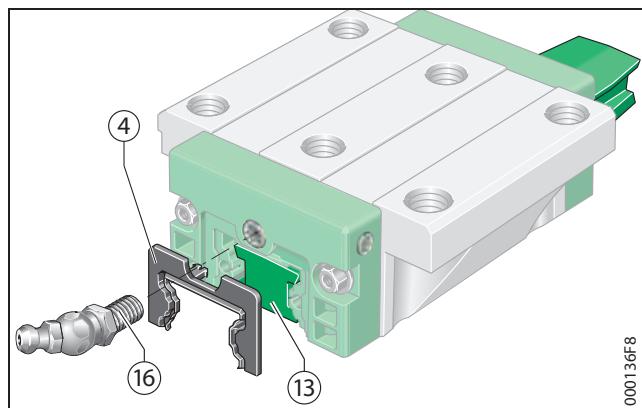

## Preparations for fitting the KIT

- Remove lubrication nipple ⑯ or screw plug
- Remove the front wiper ④ at the end on which the KIT will be mounted.

The parts that have been removed are no longer required. Dispose of the parts in accordance with the applicable regulations.

### Caution!

The dummy guideway ⑬ should remain in the carriage whilst the carriage is separate from the guideway.

000136F8

## Fitting KIT.KWVE..-B-400 (430)

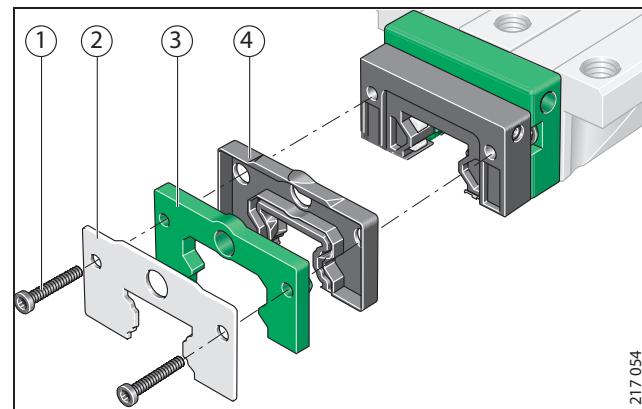

- Assemble double lip additional wiper ④ and carrier plate ③.

For KIT.KWVE..-B-430 only:

- Mount the end plate ② on the carrier plate ③.

KIT.KWVE..-B-400 and KIT.KWVE..-B-430:

- Tighten the fixing screws ① slightly.

217 054

## Slide carriage on guideway, final fitting of KIT

### Caution!

The KIT centres itself on the guideway.

The end plate must be centred manually.

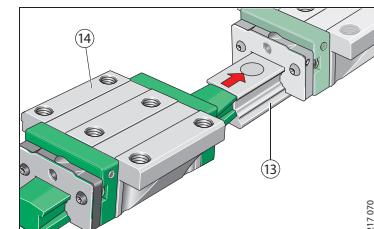

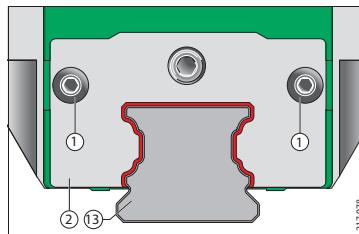

- Slide the carriage ⑯ onto the guideway ⑯.

For KIT.KWVE..-B-430 only:

- Align the end plate ⑯ with the guideway ⑯ so that there is a uniform gap all the way round.

KIT.KWVE..-B-400 and KIT.KWVE..-B-430:

- Tighten the fixing screws ⑯, observing the tightening torques.

## Lubrication

### Caution!

Avoid contamination of grease, lubrication holes and tools.

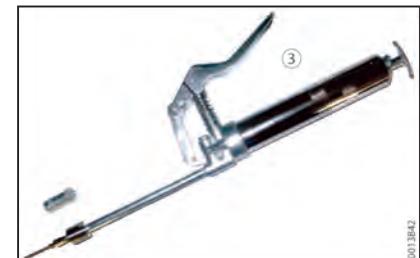

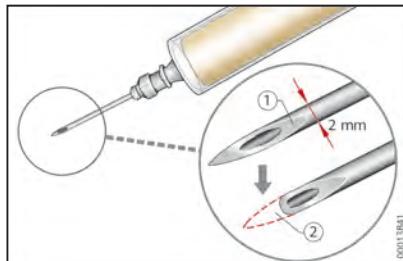

Use only the following grease:

Notropeen LXG 000, see page 15.

When using a conventional injection syringe, observe the needle outside diameter of 2 mm ⑯ and round off the point ⑯.

Grease syringe ⑯ available as special accessory.

Please contact us on this item.

## Lubrication

### Caution!

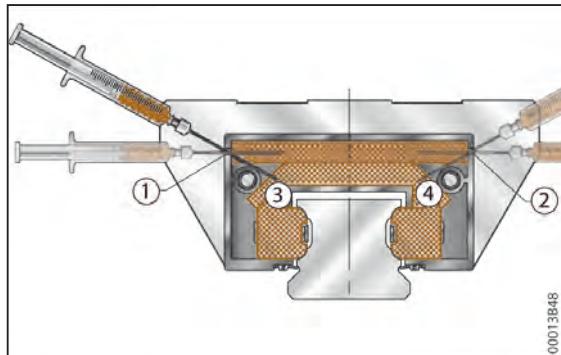

Always move the carriage during lubrication.

The minimum stroke is four times the length of the saddle plate.

Distribute the grease quantity evenly over the four positions.

In order to achieve uniform distribution of lubricant:

- introduce one quarter of the lubricant quantity, see page 13, at position ⑯
- repeat the procedure for positions ⑯, ⑯ and ⑯.

## Lubrication interval/lubricant quantity

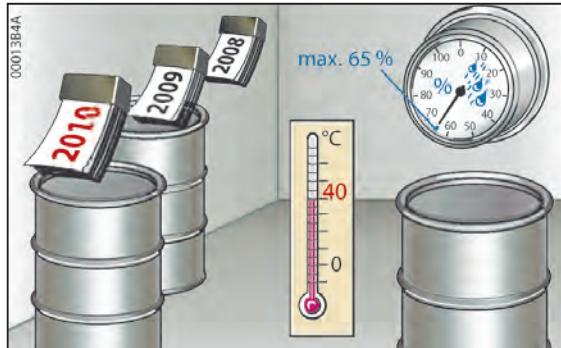

### Caution!

Grease is subject to ageing and we recommend regreasing at least every two years.

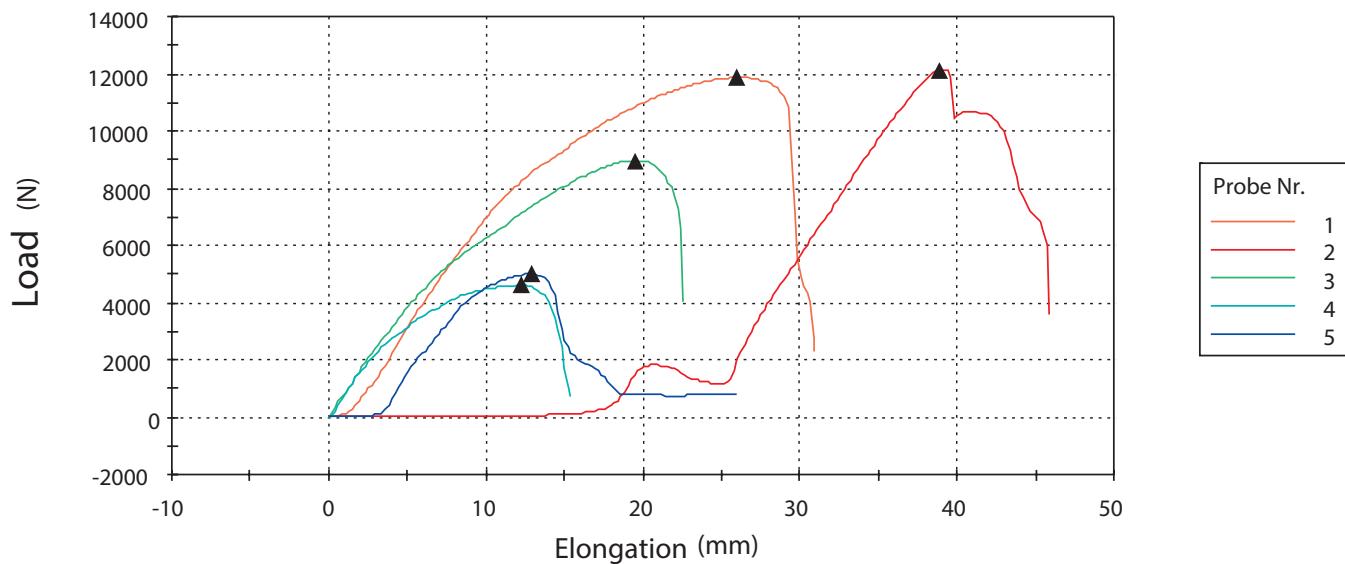

The relubrication interval depends on the application. It is influenced by factors including stroke, the load and the ambient conditions, see catalogue PF1.

Precise values can only be defined under the actual operating conditions of the particular application.

The relubrication quantities are given in the table.

Probe 1 bis 5

	Breaking load (N)	Pre-break elongation (mm)	Belt type
1	11868,7	26,035	RPP8M40
2	12140,2	38,947	RPP8M60
3	8969,4	19,473	RPP8M30
4	4610,2	12,277	RPP5M22
5	4995,5	12,912	RPP5M25
6	3613,498	11,034	RPP5M40

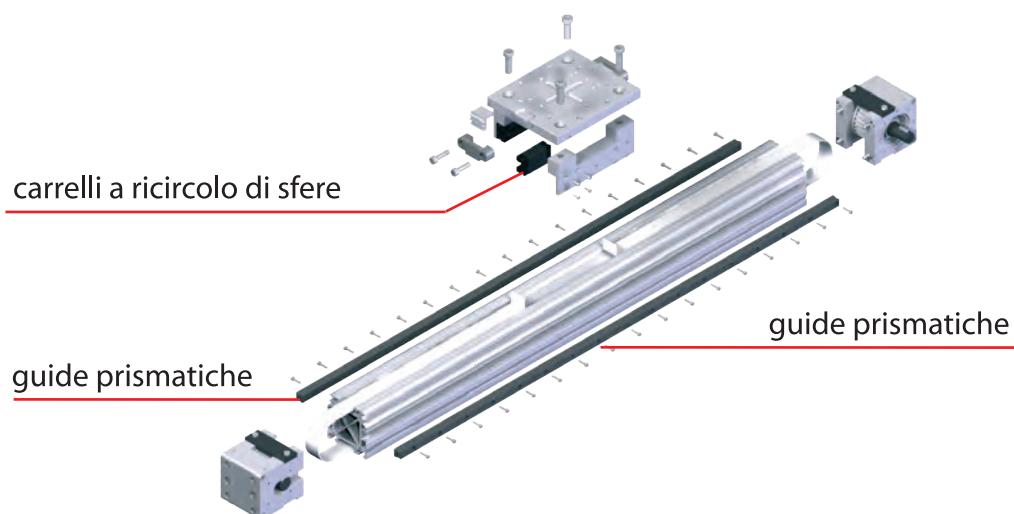

## BELTS SPECIFICATIONS

WIDTH TOLERANCE     $\pm 0,5$  mm  
 PITCH TOLERANCE    +  0 / -0,4 mm /1000 m

## Track rollers system

## Width up to 4 m
